BIODEGRADABLE E.V.A. COMPOUNDS

Declaration issued in accordance with ASTM D5511 standard

SELASTI's decades of experience in production of E.V.A. compounds, combined with our nonstop care to environmental impact and eco-sustainability dynamics, has led our research process to the development of materials mixed with special organic additives that significantly enhance their biodegradability.

These are compounds specifically studied to reduce the biodegradation timing of the material (5.25% in just 45 days), when abandoned in a biologically active environment that favors colonization and microbial digestion, and therefore the transformation into biomass, carbon and water. This excludes any start of the biodegradation process of the product when stored in a non-microbially active aerobic / anaerobic environment, such as warehouses or shops.

The external appearance, as well as the technical features of biodegradable material do not differ in any way from the standard production material.

The biodegradability characteristics have been verified and tested according to the ASTM D5511 standard, with the INTERTEK Test Report N° MUM / 004326/2019 attached to this declaration.
